

Tutorial 2

Continuous Integration (CI) / Continuous Deployment (CD)

Automated Software Engineering
Departamento de Engenharia Informática

In this class, you will create a simple personal web page using static content (HTML/CSS/JavaScript) and configure **GitHub Actions** to automatically deploy your site to **GitHub Pages** whenever you push new changes.

This exercise will give you hands-on experience with:

- Version control using Git and GitHub.
- Setting up a **CI/CD pipeline** with GitHub Actions.
- Deploying static content to production in an automated, repeatable way.

1. Create a Repository

- Log in to [GitHub](#)
- Create a new public repository (e.g., `<your-username>.github.io`)
- Initialize it with a `README.md`

2. Add Your Static Website

- Clone the repository locally
- Create `index.html` file in the repository root (you may also include CSS or JS)
- Commit and push your changes

3. Enable [GitHub Pages](#)

- Go to your repository → Settings → Pages
- Under *Build and deployment*, select **GitHub Actions** as the source
- More details: [GitHub Pages Documentation](#)

4. Configure GitHub Actions

- In your repository, create a directory `.github/workflows/`
- Inside it, add the file `deploy.yml` (the file is available at UCStudent)
- Commit and push this file

5. Verify Deployment

- Go to Actions tab in your repository to see the pipeline run
- Once successful, your site will be available at:
`https://<your-username>.github.io/`
